

HIV IN NORTH CAROLINA

In 2021, there were **34,327** people living with HIV in North Carolina. That same year, **1,390** people were newly diagnosed with HIV.

Rate of people living with HIV per 100,000 population, by Geography, 2021

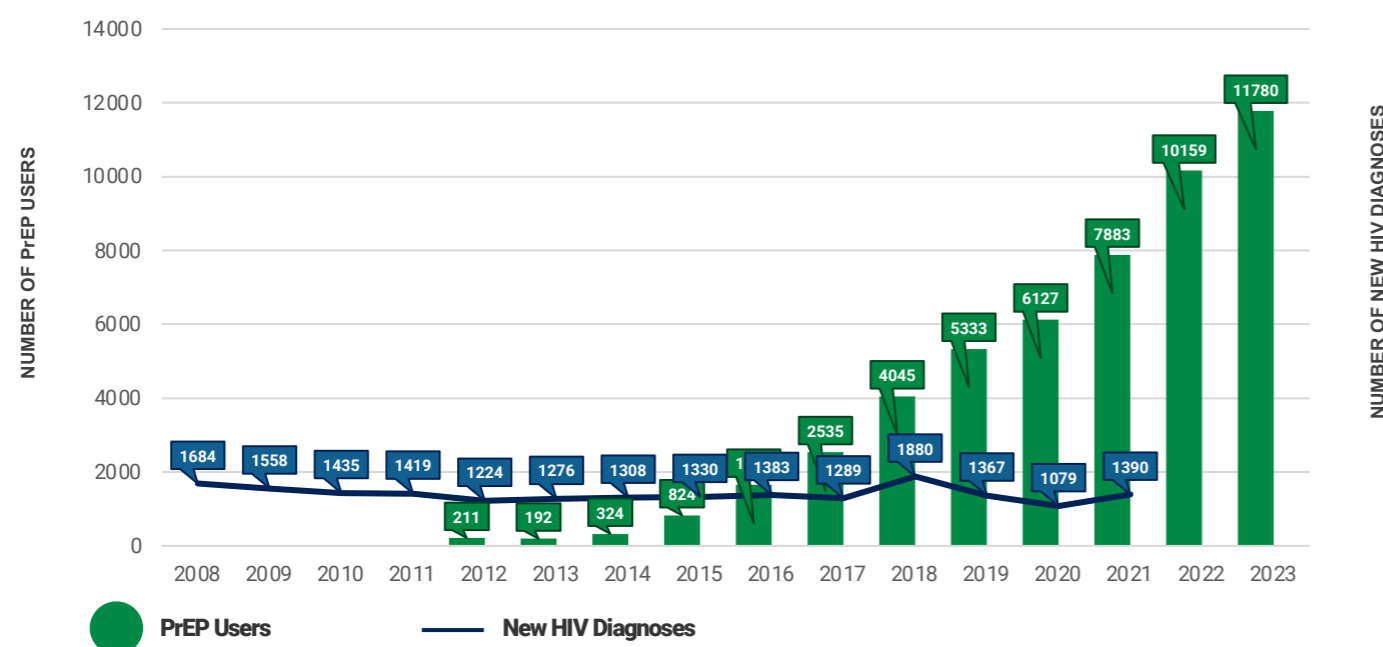

Percent of people living with HIV in North Carolina, by Race/Ethnicity, 2021

New HIV Diagnoses & PrEP Use

Pre-exposure prophylaxis, or PrEP, can protect people from acquiring HIV. We know that PrEP works in reducing new HIV diagnoses. Yet, PrEP use is not equitable. For example, **Black people represented half (49%) of new HIV diagnoses in the South, yet were only 21% of PrEP users in the region.**

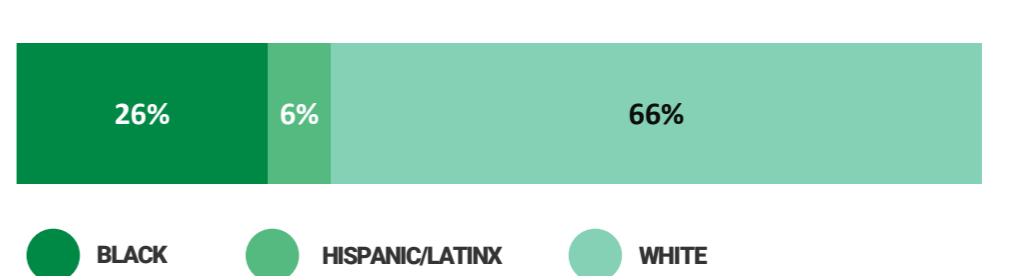

Number of PrEP Users in North Carolina, 2012-2023 vs. Number of New HIV Diagnoses in North Carolina, 2008-2021

Percent of people newly diagnosed with HIV in North Carolina, by Race/Ethnicity, 2021

Percent of PrEP users in North Carolina, by Race/Ethnicity, 2023

Viral HIV Suppression

Viral suppression is defined as those living with diagnosed HIV who had suppressed HIV viral load (<200 copies/mL).

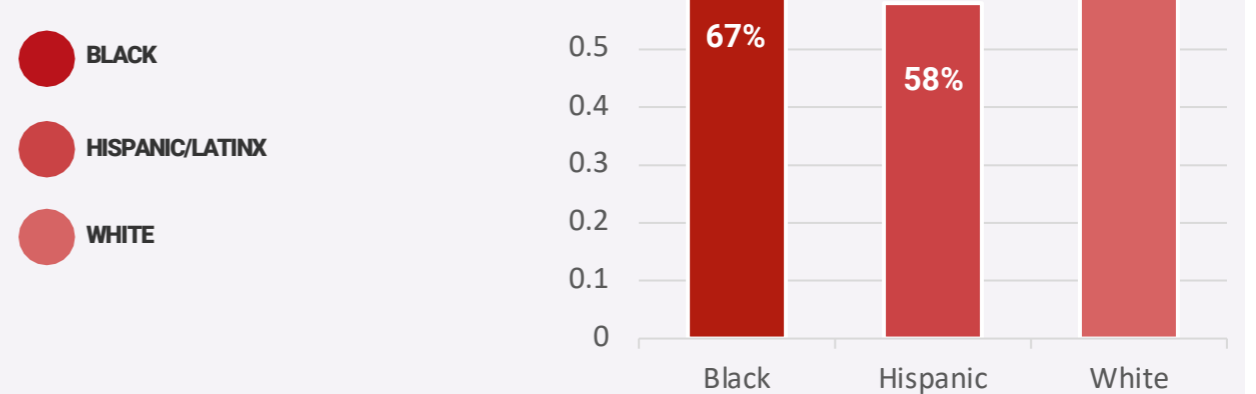

Number of people living with HIV who were virally suppressed in North Carolina, 2021:

22,383

Percent of people living with HIV who were virally suppressed in North Carolina, 2021:

68%
